New Delhi, Delhi, IN | +91-9810640153 | biswalworkanish@gmail.com | [LinkedIn](#) | [GitHub](#) |

TECHNICAL SKILLS

Languages: C, C++, Python, Kotlin, JavaScript, SQL, Bash, HTML, CSS

Databases: MongoDB, SQLite, Room Database, MySQL

Backend Frameworks: Node.js, Express.js, RESTful APIs

AI & Model Evaluation: LLM evaluation, agentic benchmark authoring, prompt engineering, adversarial and red-team scenario design, conflicting-context construction, oracle event specification, rubric design and response grading, failure-mode analysis, deterministic scoring, hardness calibration, data annotation and quality review

Systems & Tooling: Docker, containerized Linux environments, shell and environment configuration, sandboxed test harnesses, Git and GitHub (branch and pull request review workflows), pytest, JSON/YAML, regex, CLI tooling, reproducible builds

Android Development: Jetpack Compose, Material Design, Android Jetpack, Kotlin Coroutines, Hilt, Dagger 2, LiveData, ViewModel, Room Database Optimization, MVVM, RecyclerView Optimization, Android Profiler, Android SDK, Gradle, Dependency Injection, Retrofit

Testing & CI/CD: JUnit, Espresso, UI Testing, Firebase Authentication

EXPERIENCE

AI Evaluation Engineer | *Handshake AI*

Mar 2026 – Present

- Author end-to-end **agentic coding benchmark tasks** for a terminal-based agent benchmark, where each task ships a **containerized Linux environment**, a hidden reference solution and a **programmatic verifier**, calibrated so that frontier LLM agents fail while the reference solution scores a perfect run.
- Deliver tasks spanning **runtime debugging and repair**, **SQL state recovery**, **shell and environment isolation**, **file and media operations**, and **package build and release recovery**, each designed to be realistic, self-contained and fully reproducible.
- Own the **review and rework cycle** against six acceptance criteria covering contract coherence, reference correctness, verifier soundness, ground-truth protection, deterministic execution and task realism, closing Major findings and resubmitting through a **Git branch and pull request workflow**.
- Built a repeatable **validation harness** that rebuilds every task in a throwaway sandbox and runs all gates end to end: static checks, oracle and no-op scoring, tamper and hijack matrices, determinism across repeated runs, and **hardness calibration** proving partial fixes score zero.

AI Model Evaluation & Red-Teaming Specialist | *Outlier, Scale AI*

April 2025 – June 2026

- Designed **adversarial evaluation tasks** inside sandboxed **static and dynamic agent environments**, probing frontier LLMs for failure modes on multi-step, tool-using workflows.
- Engineered **conflicting-context scenarios** by planting contradictory instructions, stale state and mutually exclusive constraints across environment artifacts, then authoring prompts that forced the model to detect and resolve the conflict.
- Defined **oracle events and grading rubrics** for each task, specifying the exact tool calls and observable state changes required for a correct trajectory so that failures could be scored deterministically rather than subjectively.
- Reviewed and corrected **model-generated responses** against those rubrics, delivering verified prompt, response and rubric sets used as high-quality evaluation and training signal.

Freelance Android Developer | *Independent Consultant*

Sept 2025 – Present

- Spearheaded core application development and low-level system integration for the **Lighko Wonder** mobile device initiative, contributing to both **custom Android applications** and the proprietary **AOSP codebase**.
- Functioned as an **independent proxy engineer** providing dedicated, high-impact software development support for a client in the telecommunications sector, managing end-to-end feature delivery for complex Android modules.
- Delivered robust, performance-optimized solutions across multiple client projects, **leveraging expertise in Kotlin/Java** to ensure seamless integration and stability within custom Android environments.

SDE Intern | *MobiKwik*

April 2025 – July 2025

- Contributed to the end-to-end **revamp of the KYC onboarding flow**, including benefits explanation, push step restructuring, and **income data fetching**, resulting in a **20% increase in user KYC completion rate**.

- Enhanced the **KYC CPV (Customer Personal Verification)** screen with smoother backend integration and optimized UI responsiveness, improving load times and reducing user drop-off.
- Supported the development of the new **SBM card feature**, working across onboarding and activation flows to ensure a **frictionless user experience** and timely product rollout.

PERSONAL PROJECTS

FoodGrab | *Kotlin, Bun, PostgreSQL, XML, Hilt, MVVM* | Team Project | [link](#) June 2025

- Led a team of 4 in building **FoodGrab**, a full-stack food delivery app with a clean Android frontend and a performant backend using **Bun** and **PostgreSQL**.
- Spearheaded Android development using **Jetpack Compose**, **Hilt**, and **MVVM**, delivering a responsive UI and smooth user experience.
- Integrated secure REST APIs for food ordering, authentication, and tracking, optimizing data flow and reducing API latency by 35%.

EDUCATION

Delhi Technological University (Formerly DCE) New Delhi, India
Bachelor of Technology in Electronics and Communication *Dec. 2021 – May 2025*
– *Minor in Computer Engineering*

POSITION OF RESPONSIBILITY

Corporate head | *STEP-DTU*

- Led the corporate division of STEP-DTU, driving fundraising efforts, securing sponsorships, and coordinating welfare activities such as trips, meditation sessions, and workshops, while maintaining strong relationships with corporate partners to support the society's initiatives and events.

ACHIEVEMENTS

- **Solved 650+ Data Structures and Algorithms problems** across platforms such as [LeetCode](#), [CodeStudio](#), [GeeksforGeeks](#), and [Codeforces](#).
- **Achieved LeetCode rating 1450+**, demonstrating expertise in **Dynamic Programming, Graph Algorithms & Time Complexity Optimization**.
